

MR Elbow (Flexed Elbow Valgus External Rotation "FEVER" sequence/position)

Last Updated: 12/2024

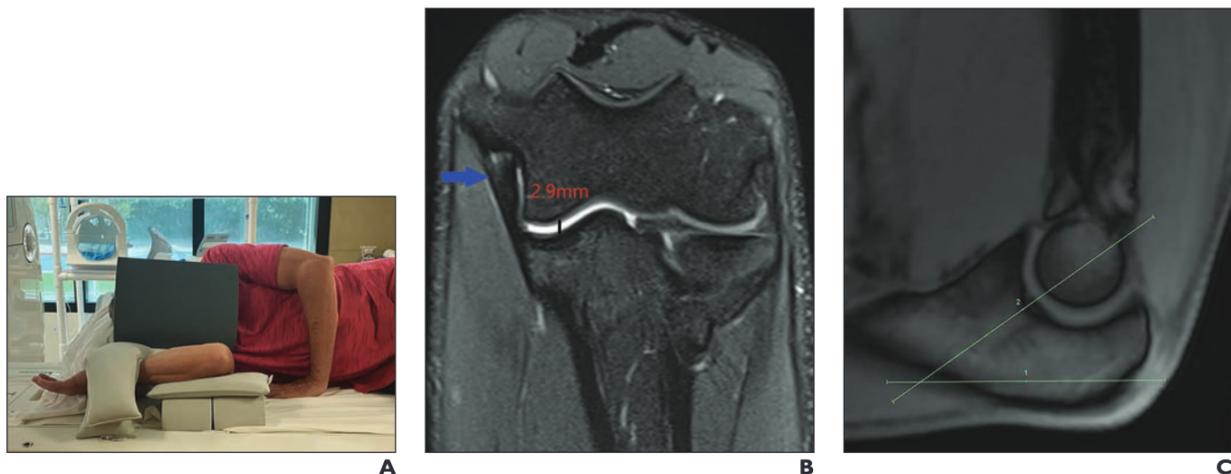

Fig. 1—Flexed elbow valgus external rotation (FEVER) view acquisition.

A, Photograph shows volunteer lying on side for proper positioning for FEVER view. Flexed elbow is elevated, and sandbags are used to induce valgus stress. Elbow coil is not shown.

B, 20-year-old male pitcher with normal elbow. Coronal fat-saturated proton density-weighted FEVER view MR image shows normal anterior bundle of ulnar collateral ligament (*arrow*) and 2.9-mm ulnotrochlear articular width (*black line*).

C, Same pitcher as in **B**. Sagittal scout image shows flexed elbow position. Lines 1 and 2 denote approximately 35° scan angle for FEVER view.
